Hi Adam, I'm only speculating, but I'm not sure that driver will do what you want. Being 88 db, even if implemented into a good front horn you'll very likely be no better than 94 db 1w/1m or so. By the time you've padded the woofer and compression driver to match you've lost the basic horn "virtues". I'd consider a Fostex 206E or similar. 102-103 db 1w/1m in a front horn. Maybe you could trade a pair of the Seas drivers? Either way, keep us posted! Jerrod
