Hello People Maybe this question sound's stupid too you but I really want to know an answer. Let's say that we are comparing two speakers with the "same" T/S parameters: One has for example this parameters: SPL = 100 dB and Power = 600 W , 15" diameter, etc... same Second one: SPL 100 dB and Power = 200 W , 15" diameter, etc... same So, the only thing different is the Power of the speaker, which is different. What is different between these two speakers besides that first one can handle more power?
