Like this, and Side B gets the same treatment, before side A is glued. Practical? I don't mind using screws to keep the panels clamped (I have no clamps). For the lab12 horn I have to buy silicon sealant to ensure it's sealed, rather than squirt 500ml of PVA woodglue down a joint, half of it missing as the bottle can't actually fit in the tight folds. :P Cheers! At the moment I'm modeling up a 32Hz bass horn, but having trouble making the rear sealed chamber as small as it should be - while keeping the horn length what it should be! :-S It only takes me 1hr to CAD a horn, but it's trial and error to get a horn that has no wastage :-S
