I was trying to get a nice response for my JBL 15" in hornresp, and look what's best! conical horn! it's like the underdog of horns=People proclaim the magic of tractrix mid, and expo/hyp bass,, and the poor conical gets left behind outside PI circles...No the jbl horn isn't small- that rear chamber just can't be reduced! so I'll build my LAB12 horn next, as the rear chamber is very tiny, and the entire horn small but I do want to build the jbl horn :-P Other news: RS SPL meter, waiting for delivery (it is xmax after all) enough money for lab12 very soon.. :-)
