Wayne, I did a search under the H.Eff Speaker forum at the "other place" and found your post about 8 ohm vs 16 ohm speakers, and the need to match the impedence tap of the output transformer for maximum power transfer. Seems to make sense. However, my question now is, if the two drivers in a 2-way are connected in parallel, wouldn't you need two 16 ohm drivers to build an 8 ohm speaker?Gar.
