on my altec-pi's, I was gonna jigsaw out a hole and surface mount my 416's. however, the back of the flange has a ton of little fins on it, so no way no how. I guess I gotta mount them on the inside of the baffle? that just seems so wrong to me. any advice on what size to cut the hole relative to the speaks? (i.e. just enough for cone and surround to show through?) This definitely means router, doesn't it? also, should I use the router to flare out the opening a little bit? jeez, this is making me nervous. I have the boxes all glued up except for the front panel where i need to mount the driver and attach the port. Kevin/EZ
