But far be it from me to get hung up on semantics, the real issue at hand is what matters and what doesn't. My point has always been that what we actually hear is frequency anomalies that occur when two signals are phased for destructive interference. We hear the nulls, not the phase.Thanks wayne-you put things in a more clear manner!Thanks for that link i hadnt seen that post!Like you say if all the sound is 'x' uS late-whos to know!Cheers!Mike.e
