A box 24" wide, 18" deep and 36" tall would be a little under 9 cu. ft. You could divide it vertically with a front-to-rear septum with a bit of structure to mount the push pull drivers on the divider toward the top middle (looking from the front). The drivers would radiate forward through a vertical slot. Each of the BR chambers would be isolated and ports could be on the back. The width would match the mid-horn sitting on top. Could be fun.
