I could not get the Pi website software to work on my computer. The price list says the Pi Theatre 4 goes to down to 25hz. How many decibels down is the 25hz measurement? Subjectively what is the bass response like? Could the bass response be better or as good as my 1950's vintage 15" coaxial drivers loaded in bass-reflex cabinets? Except for Altec horns and high frequency drivers, my goal is to move away from vintage drivers and gain the toughness and reliability of modern pro drivers. If I would like to build the Theatre 4's with my own drivers, do I need to buy the plans? Can I get just the plans? Could I use a simple 1st or second order crossover around 800-1k hz to combine the Pi Theatre 4 with Altec horns? Does the woofer and box alignment depend on the crossover? I looked for answers to these questions in the forums but did find answers I could understand clearly. Thanks
