I received my 2118 today and dropped them into my One PI cabinets to test them out. Wow. These speakers are great! Less bass than the Alpha8, but the midrange is so clean. I bet a set of One PI with the 2118's and a subwoofer would make a terrific system. But that's not where I want to use them. I'm looking at the rising response curve of these drivers and think they'd be a good candidate for horns. Can someone point me to resources that would explain the relationship between exit area, horn length, and mouth size to frequency range and sensitivity increase? thanks, gcl.
