I definitely like the looks myself. What I originally intended to do was increase the width of the front panel to match the width of the midhorn and build the high freq horn such that it is in an enclosure that is also the same width. I was also going to build the midhorn/highhorn so that it can be rotated about 15 degrees left or right. I really like that you can't really see any drivers, so there is no ugly grill needed to hide the drivers.
