I have a question about the mid-horn enclosure for the 7-pi Studio. I am going to try to set up the construction to allow for some horizontal angle adjustments, but that feature may require that the mid-horn enclosure be modified for clearance when placing into the corner. What are the restrictions associated with modifiying the mid-horn enclosure? Size, depth, height, width. Obviously the driver itself and the horn "flare" dimensions are a limiting factor, but are there other restrictions to consider?
