Subject: 2 pi speaker terminal idea

I've almost got my cabinets put together (have the front panel to put on--yeah, yeah I know probably the wrong way to go about it, but..) and was thinking that it sure would be nice to be able to get into the bottom half of the cabinet to deal with damping and such. I didn't want to make the front or any panel removable anyway, but thought that if I cut a larger square, say 6" x 6", then glued that piece that came out of the back to a slightly larger 1/2" thick piece that would have the normal size square cut out of it for the terminal box, then I could seal and attach it and still be able to get back in easy. This way the original piece out of the back would fill most of the hole and the plate would seal the cabinet. Would this cause any unforeseen problems that anyone would know of. I really want to make these come out right.
