I'd go with an Eminence HL10A in a 1.0ft<sup>3</sup> box tuned to 30Hz. That will generate strong output to 30Hz. If you need a smaller cabinet, the HL10A can be used in cabinets as small as 0.35ft<sup>3</sup>. In a small 0.35ft<sup>3</sup> cabinet, tune to 40Hz for f<sub>3</sub> of 50Hz. You could also make a cabinet sized somewhere in between, say 0.5ft<sup>3</sup> tuned to 40Hz (f<sub>3</sub> = 40Hz) or 0.75ft<sup>3</sup> tuned to 35Hz (f<sub>3</sub> = 35Hz).
