---

There is a lot to understand when it comes to speaker building and peaker design considerations. What are some good resources (books, websites, etc.) for learning more? Most of what I have found either assumes you know nothing and doesn't go into enough detail or assumes you are already well versed and starts off too advanced. Are there any resources that explain not only T/S, crossovers, and bass cabinet dimensions, but also how those things affect imaging, coherence, etc. Also, how the radiation patterns of different drivers and/or configurations (such as horn loaded versus direct radiating) affect the sound of a speaker. Thanks
