Ok so I un-wrapped the battery to find two, what I would call, barrel batteries. Look like 1/2" tall watch batteries. Brought them down to the local Radio Shack. There were no identifying markings on the batteries at all. The Radio Shack guy had no idea. Anyway I ended up just taking one 3V Camera Flash Battery which was the same size as the two barrel batteries and soldered it in to see if it worked. And it did! Hopefully it will keep working. I just guessed at the voltage since most CMOS batteries were 3V. Any thanks guys.Much appreciated!
