Wayne, I went way back in the archives, found a previous post about this. You had mentioned that a crossover can be asymmetrical, and other techniques used to flatten the response curve, etc. I will play with this active xover, see what kind of results I get. The horn I will try is good down to 700 hz, so that's covered. What I wanted to do was get away from the 2000 hz peak on the woofer somewhat. I may just go on and use passive xover components.
