The big problem I had (20 years ago and now) was that most hi-fi's are only 80 something dB's (my small tannoy's are only 86dB's). My 'hi-fi' (home buit 20 y.a.) and still working, read speakers, is 100+dB's. I can then move volume, treble and bass up and down, and definitely I can hear HF's (105 dBs) very well like in the Disco. I have more of a 'Saturday Night Fever - dance party' at home than a THX 'Home-Theater'. (Who care's?)
