I still haven't decided whether to build the 7 pi's or not. It seems like I'm heading towards the 15 version though, but I have one question regarding the cosmetics: Is it possible to build the bassbin the same width as the midrange horn as long as I keep the internal volume the same by making it a little bit lower? If necessary the sidewalls could also be built diagonally, as long as the front wall are wider. What do you think?
