Hello everyone: Newbie here...so bear with me.....I have a remote cabin off the grid and want to "stereoize". I run off 12V (with inverter) and have decided to work the reknowned T-Amp, right now with a set of wall mounted Mission M-70s, but I might bring up the Studio Series Two that I will be building shortly. I want to consider suspending these from the cathedral type ceiling and want to know what acoustic compromises that would bring. Are there other Pi speakers more suitable(future project)? If feasible, could I chain link them? Any thoughts.....?Roland
