the Qd value for the alpha 10 in the pialign data base that comes with the software is 2 but according tot he emminence website qts is .59 for the alpha 10 and the Qd should be $1/.59 = 1.69$. When I plug in 1.69 into pialign I get a slightly bigger enclosure that the one in the 2pi design. Why use a different QTS than what is provided in the emminence spec sheet? Thanks Paul
