I was referred here by one of the moderators at audio karma. Where I asked about ~ HIGH GRADE ~ DIY ~ Speakers. I would like speakers that would be at par with the gear I have, and listening style. I could do corner horns, I guess. I am not familiar with the options avail here, also considering my ignorance on the speaker side of the fence. I like Jazz and Rock n roll, Loud and also as background music. I have three very good tube amps. All have the very sweet sounding 7591 output tubes that Terry Dewick from [www.audiokarma.org](http://www.audiokarma.org) updated. I could bi-amp with a very solid Pioneer SX 1050 to drive the woofers. My only concern would be spkr impedance/load on the tube gear. I would think that a single amp circuit would be much easier. . . suggestions? Are Corner horns a good choice for someone who likes speakers that produce good Detail, And also solid Bass (Not Boomy)? If It's corner horns, the only place I could put them is at the ceiling corners, up the wall. I have a cathedral ceiling. They would angle out perfectly. I do prefer speakers up on a wall. Thank you for your time. Brad
