You can approximate and round to the nearest 1/8th inch. In fact, when I did the prototype, some measurements were only accurate to 1/4". Near the throat, it's best to be as accurate as possible but further out, you can be off quite a bit without any adverse effects.We plan to make a flat-pack

flat-pack kit is going to be about $750.00. That's a steal when you realize that the wood alone costs about $300.00, even at good wholesale prices.
