Hi dB, thanks for the link. Very impressive products. Here we have also phenolic plywoods used for concrete work (now I'm use it) , but I'm afraid that ours are made with pine. The point is , as far as I know, veneers fibers homogeneity to avoid unwanted voids. I will check tomorrow at work, how good can be our phenolic boards for speakers matters. Having also MDF here, of course, it will be a nonsense import baltic birch or othe fine board, by the way. Maybe we can add some sealing product before apply the vanners to increase moisture protection. Also, we can use some poliurethane treatment over the vanners to add the wanted finish and protection. Best for you. p.s. wich Pi speakers do you have or proyect it?
