Hi Wayne. I want to make the center speaker a match for the 7Pi, and I want it to look nice too. So if I make it the same width and depth, as the midhorn, and considering the height that will fit under the screen, it will turn out to be around 145 liters. The 7Pi is about 60 liters ex. port, the port is 140cm² x 38cm, giving a tuning of about 36hz. 1. What tuning should I go for in the center speaker, when I don't have the corners to help out in the low bass. 2. Should I fire it towards the wall, and make some sort of reflector? Regards Kim
