Due to size constraints and my despire to use the PSD2002, is it possible to build a Studio Two Tower (with the Alpha 10") and to use the PSD2002/H290 in place of the Vifa DX25. If so what changes would be necesary to the X/O?Alternatively, would the Thermonice Three be better and have more bass? I could possibly just about go to this size if I had to!Do either of these require a sub woofer? Apparently the Two Tower does not, but what about the Thermonic Three? The Theatre Four are just not possible and I know that these would be the ideal solution!The amplifier to drive these will be a 300B S.E.T.Many thanks and any comments would be valued.Derek
