Thats without a doubt the most beautiful wood audio product I've seen. I could invision it in a museum collection of modern industrial art forms. I wonder, did it take many prototypes to get the desired response pattern you were shooting for? Do horn response programs give inner curvatures as well as the length width size and depth of the throat and mouth of the horn. I'd thought someday of trying a wood horn but just using the emminence h290 as a guide for the parameters. This one looks a little bit larger than the h290. More coverage horizontally? Better smoother response? Thanks Wayne. I'm sure this will be a sucessful product for you. I just don't have that kind of money, hense the diy.Rick
