I assume the idea is to put the seven on the floor, so it is in the floor/wall junction. That would be OK for the bass bin, not eighth-space from a trihedral corner, but quarter-space from two boundaries. It will have a smidge less bass, as dB said, but it would be fine. What I wouldn't want is the midrange and tweeter to be lying on their side too. I would probably move them up a foot or two on maybe a stand or something. You won't have the magic of corner-loading, but you'll have a really good center channel.
