Took some SPL readings at 1 meter between the speakers with the Stereophile test CD with the meter set at "C" weighting 'slow', 80dB.Using the corrections on the Audiogon board by Sean:1k 75dB200 77160 79.5125 81.5100 8480 83.563 79.550 77.540 76.525 75Ambient noise level seems to be about 50dB. The increase between 80 and 125 Hz is at a point a little higher in the spectrum than I would have thought. +9dB at 100 Hz is a little odd? Room is 15x28x8 with lots of stuff in it.Does any of this mean anything?
