> Power handling is 600Wrms. Given that this is mostly the power rating of the bass driver, does that translate to safe power for the high freq. driver? Reason I ask is that when I crank mine to clipping slightly on the amp (~450W), the protection lights are on a significant amount. Is that protection light usable as a power warning light, or can this go on all night safely? Next adventure is biamping the PSD2002. How can you tell when you've reached the power limits in this situation (no passive crossover w/power limiter lights)? Thx, Chris
