Subject: Re: Four pi power rating!!! Posted by Chris R on Wed, 21 May 2008 17:57:11 GMT View Forum Message <> Reply to Message

> Power handling is 600Wrms.Given that this is mostly the power rating of the bass driver, does that translate to safe power for the high freq. driver? Reason I askis that when I crank mine to clipping slightly on the amp (~450W), the protection lights are on a significant amount. Is that protectionlight usable as a power warning light, or can this go on all night safely?Next adventure is biamping the PSD2002. How can you tell when you'vereached the power limits in this situation (no passive crossover w/power limiter lights)?Thx, Chris
