Wayne, I've been using the Two Towers nearly exclusively with the 12B4 amp since I got the cabinets together two years ago--they sound quite good together. This weekend I hooked up the NAD BEE amp to them and was really suprised with the high end. It was somewhat harsh most of the time (way past the sparkle zone) and I found I was having to roll the high freq. off on the amp almost all the way with every CD I put through. The CDP is a NAD BEE as well, and I've never had this be as bad with some of my other speakers. The amp/CDP combo tends to lean toward the high freq. side a little and I've always rolled it down just a hair. One thing about the NAD tone controls is that they do a very good job of just effecting the very upper/lower end, not like the old tone controls of the past. Is there anything I can try to "tame" the tweeters just a little?
