The ART arrays have recessed upper midrange around 2kHz, what I usually call the overtone region. It's the edge of stringed instruments and the rasp of voices. So maybe that's what you're

ART Arrays have a bit higher output around 500Hz to 1kHz, but that sounds more like presence. It's upper midrange, the C above middle C and the octave above that. But the second octave

the real difference in tonal balance between these two speakers, not the tweeter but the upper end of the range covered by the midwoofer(s).
