Hi AllI just built my first 4Pi prototype and it looks bigger than i thoughtI'm having serious WAF problems I could try moving some furnitures and/or choosing a proper color/veneer for better integrating these 'refrigerators' (this is how my wife calls them! hehehe) into the roomOr I could try to make smaller boxes Without changing components and keeping the standard crossovers, what would be the minimum box volume for getting a working 4Pi?Omega Pro 15 works in boxes from 2 to 3.8 cu. ft. Does it mean that I can do a 4Pi in a 2 cu. ft. box?Will it sound close to the original?Thanks!
