when I made mine I got some lighter baltic birch plywood made for models at Michael's, I guess about 1/4" or maybe 3/8" and used that for the port. It was real easy to work with and I used masking tape to hold it together while the glue dried. Just butt joints, as Wayne said. I spray painted the inside of it flat black before gluing it on the back of the baffle, also gave the cutout on the baffle a touch of flat black on the inside edge.
