While trying to figure out HornResp, I came up with two midbass horn layouts. The question is weather they will work in my setup, so I included both sketches.

1. Midbass ABOVE the midhigh, coupled to the ceiling: available area: 12"x34" mouth, 30" depth.
(option1.jpg)

2. Midbass VERTICAL, below the midhigh. I was inspired by this JBL horn:
http://www.jbl.com/home/products/product_detail.aspx?prod=1400%20ARRAY%20BG&Language=ENG&Country=US&Region=USA&cat=BFS&ser=PTS

Can this be made to cover 90 deg horiz x 25 deg vert? By stretching out the throat to be tall and narrow?
(option2.jpg)

Thank you.
Herman
