
Subject: Crossover Question about building line arrays

Since there are so many speakers involved does this give more crossover options?

Many people have different conceptions of where the crossover points should be handled in a line array. Also I've heard some people say that passive crossovers for line arrays are just too hard, and that people should only be thinking about electronic crossovers. What options are there for that and how expensive is that?

Sorry for all the questions but this seems to be a place where they might be answered by people who have actually built a line array.

TIA,

Wendall
