The new JBL CBT arrays are aimed right at the Bose systems in terms of cost. You can read about them here <http://www.jblpro.com/catalog/general/ProductFamily.aspx?FId=89&MId=2>

Looks like in the coaxial system they are using a 1" dome. Nice to know that I helped design the first CBT arrays installed in the USA

We used a passive tapering arrangement and the curve applies the delay. If you run a straight column you would need to go active in order to control the delay along the length of the line.
