The stuff is tough, isn't it?  I usually use a sharp knife or razor blade.  On everything else, I use garden variety strippers or wire cutters but on teflon, I prefer to shave it off with a sharp blade.  Similarly, on thin laquer covered magnet wire, I tend to like to scrape it off with a sharp blade.  On thick wire, I sort of shave it off but on very thin wire, it's more like scraping it off, dragging the blade across the insulation to scratch the insulation off.
