I've always believed that sub woofers should really be sub woofers, and should cover the bandwidth from 14 - 30. Above that you should use a standard stereo woofer up to maybe 200 or so, and then a wide range speaker covering 200-3000(give or take), and tweeter systems above that.

Of course there are lots of ways to do it. I don't need the subwoofer part since I only listen to music with my system, and would NOT try to duplicate real explosions. If I need to hear real explosions, I go out to the shooting range and target shoot my S&W 357mag! Knowing what a real explosion sounds like, I'm not interested in duplicating it!
