So I take it that you don't have a line array?

I'm from the old school(meaning stereo systems from the early 70's and late 60's. You get this when you are more than 60 years old.

But I really don't see a problem with a line array with what you want. Its not hard to find a high xmax speaker that will do 200-3000 and a set of nice B&G neo ribbons, and stereo woofers.

It's be a three way unless you need to hear explosions, and then you need what my old school would call a sub woofer, and for that you will need a 10 cu ft box with two 15 inch woofers in it covering the 14-29hz range only. At that frequency range it will truely be non directional.
