Jamo is a pretty famous and well respected brand in Europe. They are now owned by Klipsch and Klipsch has pretty much not interfered with their production line.

PE is now selling a whole series of their raw speakers for about 9 bucks each. Problem is that there is no curve data anywhere on the web that I can find. It looks like their 8 inch models MIGHT work great for a 50-155 midbass array and at 9 bucks each, you could put in a mid bass array.

This is the only spec they have available: \*Power handling: 50 watts RMS/100 watts max \*VCdia: 1" \*Le: 1.18 mH \*Impedance: 8 ohms \*Re: 4.81 ohms \*Frequency response: 40-2,500 Hz \*Fs: 46 Hz \*SPL: 90 dB 1W/1m \*Vas: 2.2 cu. ft. \*Qms: 5.26 \*Qes: 0.90 \*Qts: 0.77 \*Xmax: 1.5 mm

While the x-max is pretty low the efficiency is pretty high.

You could put in a seal design with an equalizer and with that pretty high efficiency put 9 on a side with a combined xmax of 13.5(still less than my 12 inch woofers, but how much air do you really need to move at only 50hz.

Thoughts anyone?

Marlboro
