Hi all,
thanks to Wayne for sending me the 12pi plan.
I'm trying to sim this cab in akabak. But I have some question.
One driver fire in the throat chamber the other one in the rear chamber, but both driver are connected in parallel.
So I substract all the driver volume from the throat chamber and I add the cone volume to the rear chamber.
For the other driver I added the cone volume to the throat chamber and substract all the driver volume from the rear chamber.
Am I right?

cheers, bitzo
