I repaired the connection to the solder pad (tell me again why pads are more desirable than thru-hole?) of the 6.8uF cap, put everything back in and the 4Pis are sounding great.

Trying something different today: the speakers are 50" out into the room which makes them a bit less than 96" to my ears. Bass weight is reduced but the image is airy, wide and deep. As I don't have a corner for the right speaker, this may be the best position for this room. Have to get used to electric bass sounding transposed an octave higher!
