Subject: X-over Cap Voltage rating

Wayne,

I have a question concerning your recommended voltage rating of at least 250v for crossover caps (specifically for the 4pi x-over); you spec at least 250v. Are there any exceptions, and if I'm running low power SE amps (~5W), could I get away with a 200v rating? The reason I ask is, it would open up more options as far as selection. If anyone else wants to chime in, by all means.
