No problems regarding load on the amp. Right now the amps in my AVR are quite robust and powerful for it's class. It's good for a 3ohm load if required. I may even upgrade to a pro amp down the road so loads down to 2ohm pose no real issues at the moment.

So if I read your reply correctly I can hook both woofers to the lowend output of your crossover but with a inductor in series between the bottom woofer and the output of the crossover? Is that right? Or do I just hook the midwoofer to the network and have just the inductor on the bottom woofer?

Sorry, just want to be sure.

Thanks a ton!
