Yeah, I was wondering what you were going to do about those shiny edges. I expected you would want to paint them.

A word of warning, if you really put the power to these, the resistors in the tweeter circuit can get pretty warm to the touch. I saw that you used what appears to be an adhesive. It's probably OK, and even if it got hot enough to melt the adhesive, that probably wouldn't do anything bad. But I did want to put a bug in your ear about it. I've had the resistors melt plastic nearby when used at high power levels for extended periods of time. It will burn right through a wire tie, for example.
