If you want something that's not manufactured, I might suggest you contact Tom McNally about building you one. He makes a lot of small wattage amps (Darlings, 6EM7's, etc...). He's on the diytube.com website.

Another option is that over on the Hawthorne audio site they have a small spud amp kit that is based off of one of Jef Larson's designs (Abraxasaudio). It's a great amp that will give you 2-3 watts for a little over $300 in parts and that includes the powdercoated drilled chassis. If you can solder at all you can build this amp. I've owned one of Jef's amps before and I can tell you whatever he designs is solid.
