Your ear can hear down to 20hz. Your ears can also pick up sound by it conducting through the inner ear bones and it can cause resonance in your body.

You are hearing it too, our ears start rolling bass off though so the conduction is more pronounced at these frequencies. That's probably because we amplify it elsewhere in the body and it has a bigger effect. Bass can physically move air like a blow dryer just as treble can feel like it is melting the hair on your ears as it screams by.
