Pretty soon I'll be blasting HUGE wattage thru them. No more 2 watt 45s or 6 watt 6CA7s, no sir. I just orderd this powerhouse T Amp with an astounding 12 Watts into 8 Ohms!

I ordered this partucular one because the vendor was the only one with 8 Ohm numbers and he included the following totally accurate description:

"The Topping T-Amp is a so-called Class T integrated amplifier, based on the TA 2020 chipset. the chip makes use of a kind of "Digital Power Processing", this is, more or less, a Class D amplifier with high rate switching properties. That is why they put the word "digital" into it. Actually, there's nothing really digital inside, not in terms of D/A conversion. You can view the official TA2020 datasheet, with detailed tech specs, The Topping T-Amp is nothing else than a pure and simple application suggested by the chipset datasheet. No magic"

I also like the parts selection

Having it also means my grand daughter can safely be around the stereo or TV which is really reason number one!

Should be interesting...
